Artificial perception, communication, embodiment, and expressivity in music

George Tzanetakis,
University of Victoria, Canada
Computer Science Research Week,
NUS - 2021

George Tzanetakis, University of Victoria
Outline

- Background
- Artificial intelligence in music and beyond
- My interests
  - Perception
  - Communication
  - Embodiment
  - Expressivity
- Future challenges and opportunities

George Tzanetakis, University of Victoria
Technical Background

- Main focus of research has been Music Information Retrieval (MIR)
- Involved from the early days in the field (1999-2000)
- Have published papers in almost every ISMIR conference and in most MIR topics
- Organized ISMIR 2006 in Victoria, Canada
- Tutorials on MIR in several different conferences

George Tzanetakis, University of Victoria
Music Background

- Messing around with a piano keyboard from when I started learning piano until today
- Music theory and composition studies
- Saxophone performance (classical)
- Musical contexts and practice:
  - Rock bands in high school
  - Greek folk music in university
  - Jazz and classical music in university and graduate school
  - Today experimental music

George Tzanetakis, University of Victoria
Why?

- The question of whether a computer can think is no more interesting than the question of whether a submarine can swim - E. Dijkstra
Maybe it actually is interesting

- Personally my main motivation is to better understand and appreciate the complexity and beauty of human music making

George Tzanetakis, University of Victoria
Artificial Intelligence (in music)

Paraphrasing my favorite quote by G. Box - “All models are wrong some are useful”

“All artificial intelligence systems are not intelligent some are useful”

The old driving vision: the great celestial jukebox
The new driving vision: a virtual musician

Parting lesson: to build useful systems integration of all CS disciplines is needed

George Tzanetakis, University of Victoria
Deep Learning is not AI

Projects: binary CNNs, Unets for music transcription, siamese networks for singer clustering.....

Claimed no feature engineering but the reality:

ML: parameter search (blind), feature design (informed)
DL: architecture/layer/parameter search (blind) loss function (informed)

George Tzanetakis, University of Victoria
Projects

Projects from my own body of work beyond your typical ML system:

- **Perception**: teaching a virtual violinist to bow
- **Communication**: markov logic networks and a programming language for stream processing
- **Embodiment**: music robots
- **Expressivity**: hybrid synthesis for expressive drumming, soundplane, augmented reality theremin

George Tzanetakis, University of Victoria
PERCEPTION

"HIS MASTER'S VOICE"

This trademark and the trademarked word "Victrola" identify all our products. Look under the lid! Look on the label!

VICTOR TALKING MACHINE CO., Camden, N. J.

George Tzanetakis, University of Victoria
Physical Modeling Meets Machine Learning: Teaching a virtual violinist to bow

- Digital sampling can provide high-quality sounds but lacks the intimate control afforded by acoustic instruments.
- Physical modeling synthesis works by directly simulating the physics of sound production rather than storing waveforms.
- It has the potential to provide expressive control but like real instruments this control is not trivial and needs to be learned.

George Tzanetakis, University of Victoria
Main idea

- As in a real violin correct bowing requires feedback (both auditory and haptic)
- Learn the mapping of control-parameters to good sound rather than explicitly program it
- Teach rather than program
- Basically develop a virtual ear
- Graham Percival - Masters at UVic, PhD at the University of Glasgow, PostDocs at UVic and NUS

Quote: With great control comes great fragility

George Tzanetakis, University of Victoria
Physical Model

No recordings of violin performance; we use physics [1]

- Wave equation for a stiff string with modal dampening
  \[
  \rho_L \frac{\partial^2 y(x, t)}{\partial t^2} - T \frac{\partial^2 y(x, t)}{\partial x^2} + EI \frac{\partial^4 y(x, t)}{\partial x^4} + R_L(\omega) \frac{\partial y(x, t)}{\partial t} = F(x, t)
  \]

- Implemented as a C++ library, published under GNU GPLv3+

**Input parameters**

- Violin string number \( s \)
- Left-hand finger position \( x_1 \)
- Bow-bridge distance \( x_0 \), velocity \( v_b \), force \( F_b \)

George Tzanetakis, University of Victoria
System Architecture

Input
- Music notation
- Note data

Control
Virtual violinist (Controller)
- Select classifier
- Audio analysis and SVM classifiers (Sensor)
- Sound quality

Physical parameters

Output
- Video file
- Audio file
- Audio signal

 OPTIONAL

George Tzanetakis, University of Victoria
Before and after training

The virtual violinist plays scales and simple exercises. A human teacher rates each notes on a scale from 1 to 5. After several rounds of training the virtual violinist has learned the mapping of control parameters to good sound.

George Tzanetakis, University of Victoria
Playing a piece

Input

George Tzanetakis, University of Victoria
COMMMUNICATION

George Tzanetakis, University of Victoria
Three views of Human-Machine Communication

- Human-Computer Interaction (pressing buttons, viewing screens, listening to sounds, gloves with sensors, virtual reality)
- Programming Languages (structured textual or visual ways of creating software and hardware systems)
- Machine learning (collection of annotated data typically by humans)

George Tzanetakis, University of Victoria
Arpp programming language
(Jakob Leben)

- Syntax based on recurrence equations (write code like you write math)
- Supports infinite and multi-dimensional and multi-rate arrays (streams)
- Efficient compilation using polyhedral compilation

https://arrp-lang.org/

George Tzanetakis, University of Victoria
Arpp examples I

Write code like you write the math - using the same equations

\[ y[0] = 0; \]
\[ y[n] = b \times x[n] - a \times y[n-1]; \]

Work with signals at different rates

\[ y[n] = x[n \times \text{hop}] \]

George Tzanetakis, University of Victoria
Arpp examples II

Work with multi-dimensional streams

\[ y[n,k] = x[n+k] \cdot w[k] \]

Do math with entire signals

\[
\begin{align*}
x[n] &= n; \\
y &= \sin(x/100\cdot2\cdot\pi) \cdot 0.5;
\end{align*}
\]
Musical analysis of audio signals using ML

- Most existing recent approaches focus on a specific aspect (beat, tempo, chords, structure) and use data-driven ML models
- What is missing:
  - Human music perception understanding is holistic, hierarchical and multi-faceted
  - No easy way to communicate existing knowledge such as rules of harmony
  - No easy way to communicate partial knowledge dynamically

George Tzanetakis, University of Victoria
Musical analysis of audio signals using Logic

- A more traditional alternative is to formulate music analysis tasks as inferences using logic formulations
- What is missing:
  - Uncertainty about rules is difficult to handle
  - Low-level information extracted from the audio recording is difficult to integrate

George Tzanetakis, University of Victoria
Markov Logic Networks (MLN)

- Expressive formalism that combines probabilistic graphical models and first-order logic inference
- Highly flexible and expressive language for the harmonic analysis of audio music signals
- MLN is a set of weighted first-order logic formulas that can be viewed as a template for creating a Probabilistic Graphical Model
- Softens logic rules from true/false to probabilities

George Tzanetakis, University of Victoria
MLN example

Basic idea in Markov logic: to soften these constraints to handle uncertainty. The weights reflect how strong a constraint is.

<table>

<tbody>
<tr>
<td>A major chord implies an happy mood.</td>
<td>$\forall x \text{IsMajor}(x) \Rightarrow \text{IsHappyMood}(x)$</td>
<td>$w_1 = 0.5$</td>
</tr>
<tr>
<td>If two chords are neighbors, either the two are major chords or neither are.</td>
<td>$\forall x \forall y \text{AreNeighbors}(x, y) \Rightarrow (\text{IsMajor}(x) \Leftrightarrow \text{IsMajor}(y))$</td>
<td>$w_2 = 1.1$</td>
</tr>
</tbody>
</table>

Example of a first-order KB and corresponding weights in the MLN.

Ground Markov network obtained by applying the formulas to the constants CM and GM chord.

George Tzanetakis, University of Victoria
MLN for Chords/Structure

Flexibility of MLN: Prior global structural information

Formulas added to express the constraint that two same segment types are likely to have a similar chord progression.

The predicate $SuccStr$ allows considering wider windows, as opposed to consecutive frames via the $Succ$ predicate.

George Tzanetakis, University of Victoria
Results for chord/structure

- **Test-set**: 143 hand-labeled Beatles songs → Removing songs for which the structure was ambiguous.
- **Evaluation measure**: chord label accuracy.

George Tzanetakis, University of Victoria
EMBODIMENT

George Tzanetakis, University of Victoria
Human-Machine Improvisation

- In 2004 I joined the University of Victoria as an assistant professor
- Ajay Kapur was my first PhD student
- Ajay: “I want to make a percussion robot that is able to improvise rhythmically North Indian music with me playing the Sitar”
- Me: “That’s too ambitious - focus on something more specific”
- Fortunately he ignored me
E-sitar and Mahadevibot (2007)

George Tzanetakis, University of Victoria
The E-sitar

- Example of a hyper-instrument i.e an acoustic instrument that has been augmented with sensors to detect what the performer is playing
- Network of resistors for detecting what fret is being played
- Thumb pressure sensor for thumb
- Kiom (our version of the Wii-mote) for sensing elbow and head tilt

George Tzanetakis, University of Victoria
The E-sitar II

Aakis, University of Victoria
Real-time multi-modal beat tracking
Mahadevibot

Solenoid-based robot percussion instrument. Bobbing head visually conveys tempo information

George Tzanetakis, University of Victoria
Proprioception in music robotics

- The majority of existing music robots are literally deaf i.e. they only receive commands and react to them
- The ability to listen to the acoustic output has concrete practical applications
- Intelligent mapping of control messages to actuators (play hi-hat rather than solenoid #3)
- Volume calibration - play softly rather than reduce voltage

George Tzanetakis, University of Victoria
Drum classification for modular mapping

4 frame drums classification
Audio feature extraction followed by SVM classification

George Tzanetakis, University of Victoria
Calibration map

Adjusting how hard you drive the solenoid by how loud the sound is - learning a non-linear mapping

George Tzanetakis, University of Victoria
Mechatronic Drummer
Robert van Rooyen

The most advanced percussion robot today in terms of expressiveness and dynamic range.

Full motion control, can be driven by data from gesture acquisition.

Voice coil actuators for full dynamic range and control of strike position.

Performer-specific stochastic models

George Tzanetakis, University of Victoria
EXPRESSIVITY

George Tzanetakis, University of Victoria
Expressive drumming

- Electronic drums are simple triggers sending MIDI messages
- Not sufficient to convey the expressive nuance and physicality of percussion performance
- Adam Tindale was my second PhD student and classically trained percussionist
- Hybrid-synthesis uses a physical membrane (practice pad) to excite a synthesis model

George Tzanetakis, University of Victoria
Hybrid-synthesis for expressive drumming
- Adam Tindale

George Tzanetakis, University of Victoria
Intimate control with Soundplane - Randy Jones

George Tzanetakis, University of Victoria
The Theremin is an electronic instrument invented by Leon Theremin in 1928. It is controlled without physical contact by the performers' hands. Well-known from sci-fi movies, it can be a very expressive instrument in the hands of skilled performers. Learning to play notes is challenging because of the lack of haptic and visual feedback.
Theremin

Carolina Eyck

George Tzanetakis, University of Victoria
Mixed Reality Theremin
- David Johnson

Use an actual physical Theremin for playing and sensing the hand position

In VR place a virtual representation in the right place and provide visual feedback

Training Performance

Skills Transfer

George Tzanetakis, University of Victoria
Concluding thoughts

- Having a body (sensors and actuators) introduces layers of possible failure that provide opportunity for the sublime to occur
- Collaboration and communication between different entities - deeply personal and communal at the same time
- Music is not just pitches in time but has much richer and nuanced layers of information
- The challenges of perception, communication, embodiment, and expressivity also apply to general AI

George Tzanetakis, University of Victoria
Kadenze MIR program

- Three courses:
  - Extracting information from audio signals
  - Machine learning for music information retrieval
  - Music Retrieval Systems
